

In our software, we have the following empty state text for our noise analysis:

The rapid noise analysis updates in real time to predict noise conditions from traffic sources based on thousands of simulations. The detailed noise analysis provides a more accurate ground and facade calculation. The analysis is developed to comply with CNOSSOS-EU calculation method and the ISO standard.

I would like to shorten it keeping the following things in mind:

- no need to describe the difference between detailed and rapid analysis - can just talk about the analysis in general
- keep the reference to CNOSSOS-EU and ISO standards
- mention that the users needs to add road and railroad traffic data to run it

Please give me 3 suggestions under 40 words. Here are some style guidelines to keep in mind:

- US English spelling
- active voice
- sentence case (in headers, too)
- we use the Merriam-Webster dictionary and Chicago Manual of Style
- our tone is informative, confident, and accessible

1. "Our noise analysis operates in real time, predicting conditions from traffic data. It's designed in compliance with the CNOSSOS-EU method and ISO standards. To get started, add your road and railroad traffic data."
2. "Add your traffic data to run our real-time noise analysis. Compliant with CNOSSOS-EU and ISO standards, it accurately predicts noise conditions from various sources."
3. "Initiate our noise analysis by adding your traffic data. It's a real-time tool that predicts noise conditions, referencing the CNOSSOS-EU method and ISO standards."

there are some inaccuracies here. I'd like you to review all these suggestions with the following in mind:

The analysis doesn't always run in real time. Please remove the mention of real time. Focus more on *what* it is, rather than what a user has to do, at least in the first sentence.
