Before your start

01

Autodesk GPT

Please use Autodesk GPT (https://one.autodesk.com/apps/ai-chat/) rather than ChatGPT by Open AI or other third-party solutions.

02

Review by a human is a must

It might be tempting to just copy the generated suggestion to move forward quickly. However, we, as humans, need to ensure it's well written, both from a factual and stylistic standpoint. Carefully review the generated suggestion or ask the CXD to review it."

03

Get ready to iterate

The very first generated suggestion will not always be perfect. Be prepared to provide additional prompts and fine-tune the instructions to iterate further. For example, GPT often generates suggestions more fit for blog headlines, so it may be necessary to provide additional prompts to make it fit for product UI.

04

Save and reuse

If your prompt was a success, save it and reuse later! We can continue populating these guidelines with examples for inspiration and reuse.

05

Share context with the CXD

If you're reaching out to a content designer after you've generated some suggestions using AI, it can be useful to keep track of the interaction so that the CXD has that info for reference.

06

Keep an eye on accuracy

You may need to repeat certain requirements twice as GPT may disregard them on the first attempt. For instance, this often happens with the sentence case requirement.

07

Maybe it's not the prompt that is the problem?

If the suggestions you receive are confusing, it might also be a signal to review whether you phrased the prompt in a clear and straightforward way - a good exercise to verify if the user experience makes sense too!
